

## WEDGE & REMOVAL TOOL

**"The wedge grips the pole so securely".**

The wedge grips the pole with 3 point contact. To grip any harder will crush the pipe.

There is no removing this wedge by hand only. With such an effective wedge a special tool to remove it is the best solution.

Health, safety and environment need not cause stress. The tool developed

for this application removes the stress and risk to the operator.

**"It's so easy and no more pinched fingers using a slide hammer."**

Installing the wedge only requires a standard hammer, a driver dolly if you need. The 200mm of wedge is levered out with full control and a firm but not overstressed effort to withdraw the wedge.

The Lever kneels on top of the base in the ideal position to apply the load and can be reversed to find the right height position.

The comments noted are from the opening display.
